2011 Consumer Confidence Report

Water System Name:

Gran Mutual Water Company

Report Date: 06-15-12

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2011.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Type of water source(s) in use: Ground Water Wells

Name & location of source(s):

Well #1 located on Lava Rock Drive, Chico, Ca.

Well #2 located on Eagle Nest Drive, Chico, Ca.

Drinking Water Source Assessment information: Butte County Public Health Inspection on 8-31-2010

According to the Engineers Report Update in 2007, Gran Mutual's maximum day demand (MDD) at buildout would be approximately 643,200 gallons per day (gpd). The peak hourly demand (PHD) at buildout would be approximately 40,200 gallons per hour (gph). The water system is capable of producing a total of 936,000 gpd which exceeds the MDD for buildout by about 30%. Additionally, the water system has a total of 190,000 gallons in storage volume. The storage capacity should meet the MDD, however, this system supplements required storage capacity with additional source capacity. The water system complies with waterworks standards. No complaints have been received regarding lack of water pressure or shortage of water.

Time and place of regularly scheduled board meetings for public participation: Every third Thursday of the month

At 11:30 am at Nashes Restaurant, 1717 Esplanade, Chico. Ca.

For more information, contact: Kevin O'Shea

Phone: (530) 531-5948

TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Variances and Exemptions: Department permission to exceed an MCL or not comply with a treatment technique under certain conditions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

ppb: parts per billion or micrograms per liter (ug/L)

ppt: parts per trillion or nanograms per liter (ng/L)

health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial
 processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural
 application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the state Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, 7, and 8 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The Department allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

TABLE 1 – SAMPLING RESULTS SHOWING THE DETECTION OF COLIFORM BACTERIA											
Microbiological Contaminants (complete if bacteria detected)	Highest No. of Detections	No. of months in violation	МС	CL .	MCLG	Typical Source of Bacteria					
Total Coliform Bacteria	(In a mo.)	0	More than 1 san month with a de	•	0	Naturally present in the environment					
Fecal Coliform or E. coli	(In the year)	0	A routine sample sample detect to and either sample fecal coliform or	tal coliform e also detects	0	Human and animal fecal waste					
TABLE 2 – SAMPLING RESULTS SHOWING THE DETECTION OF LEAD AND COPPER											
Lead and Copper (complete if lead or copper detected in the last sample set)	No. of samples collected	90 th percentile level detected	No. sites exceeding AL	AL	PHG	Typical Source of Contaminant					
Lead (ppb)	5 (2010)	ND	0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits					
Copper (ppm)	5 (2010)	0.061	0	1.3	0.3	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives

Gross Alpha pCi/L	2009	0.5	0.4-0.6	15	n/a	Erosion of natural deposits.
Total Radium	2008	0.01	ND-0.03	5	n/a	Erosion of natural deposits

TABLE 5 – DETECTION OF CONTAMINANTS WITH A <u>SECONDARY</u> DRINKING WATER STANDARD **Chemical or Constituent** Sample Level Range of **PHG Typical Source of Contaminant** MCL Detections (MCLG) Date Detected (and reporting units) Runoff/leaching from natural deposits; Chloride 2-2 500 n/a 2010 2 seawater influence ppm Substances that form ions when in water; Specific Conductance 2010 238 238-238 1600 n/a seawater influence umhos/cm Runoff/leaching from natural deposits TDS 140-140 1000 n/a 140 2010 ppm

TABLE 6 – DETECTION OF UNREGULATED CONTAMINANTS Level Range of **Chemical or Constituent** Sample **Notification Level** Health Effects Language Detections Date Detected (and reporting units) The babies of some pregnant women who Vanadium 0.006-50 2009 0.007 drink water containing vanadium in ppm 0.008 excess of the action level may have an increased risk of developmental effects, based on studies in laboratory animals.

^{*}Any violation of an MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and

young children. Lead in drinking water is primarily from materials and components associated w lines and home plumbing. Gran Mutual Water Company is responsible for providing high quality water, but cannot control the variety of materials used in plumbing components. When your water sitting for several hours, you can minimize the potential for lead exposure by flushing your to seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead water, you may wish to have your water tested. Information on lead in drinking water, testing me steps you can take to minimize exposure is available from the Safe Drinking Water Hotel	y drinking ir has beer tap for 30 ad in yout thods, and
http://www.epa.gov/safewater/lead.
